

Enforcing a Secure Connection to the Web Form when Accessed via an Unsecured Channel

Article Number: 41 | Rating: Unrated | Last Updated: Thu, Aug 28, 2014 at 10:06 AM

The address for submitting the web form information is determined from the data script address set when designing the designer portion of the software on the client PC. If the data script address specified in the software in both the web form properties for the specific web form is set to use https, then whenever data is submitted from the web form, it will be submitted to the https address.

Even if someone tried to access the script to take the web form over normal http, as soon as data is submitted, it will be sent to the secure address.
